ALIGNMENTS

junctional adhesion molecule precursor - human

N;Alternate names: F11 platelet antigen; platelet adhesion molecule PAM-1; platelet F11

C;Species: Homo sapiens (man)

C;Date: 27-Oct-195 #sequence_revision 01-Feb-2002 #text_change 09-Jul-2004

C;Accession: A59406; S56749

R;Ozaki, H.; Ishii, K.; Horiuchi, H.; Arai, H.; Kawamoto, T.; Okawa, K.; Iwamatsu, A.; K

J. Immunol. 163, 553-557, 1999

                                                                                                                                                                                                                                                                   verified
                                        FUNCTION: Seems to plays a role in epithelial tight junction formation. Appears early in primordial forms of cell junctions recruits PARD3. The association of the PARD6-PARD3 complex may prevent the interaction of PARD3 with JAM1, thereby preventing tight junction assembly (By similarity). Plays a role in regulating monocyte transmigration involved in integrity of epithelial barrier. Involved in platelet activation.

SUBUNIT: Interacts with the first PDZ domain of PARD3. The
                    association

SIMILARITY: Belongs to the immunoglobulin superfamily.
SIMILARITY: Contains 2 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Involved in platelet activation.
SUBUNIT: Interacts with the first PDZ domain association between PARD3 and PARD6B probably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Seems to plays a role in epithelial tight junction formation. Appears early in primordial forms of cell junctions recruits PARD3. The association of the PARD6-PARD3 complex may prevent the interaction of PARD3 with JAM1, thereby preventing tight junction assembly. Plays a role in regulating monocyte transmigration involved in integrity of epithelial barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TISSUE SPECIFICITY: Localized
